

Salvajor Scrap Collector

Model S914

“HOW IT WORKS”

- 1 When the Collector is first turned on, hot and cold water pass through a water blender set at 107° F.
- 2 The blended water enters the tank reservoir at the rate of 2 gallons per minute.
- 3 Water begins filling the tank reservoir and rises to the level of the removable overflow pipe.
- 4 Water spills through the overflow pipe into the drain at 2 gallons per minute.

- 5 When the tank reservoir holds sufficient water, the Collector pump begins circulating water through the gusher tube.
- 6 As dishes are passed through the water plume, they are scrapped and pre-rinsed at the same time.
- 7 Food waste drops through the scrap basin into the scrap basket.
- 8 Soluble food waste washes through the holes in the scrap basket in to the tank reservoir. Insoluble and fibrous waste is retained in the scrap basket.

- 9 Excess waste water flows into the drain.
